## 1.0. Introduction

Continuing the success of the ACR1252U, ACR1552U Series is the USB NFC Reader developed based on 13.56Mhz contactless technology. It is a contactless reader that can access contactless smart cards following the ISO 14443, ISO 15693 & ISO 18092 standards, MIFARE® (T=CL), FeliCa, NFC Tags, SRI/SRIX, CTS, Innovatron, Picopass and Topaz Card are also supported.

ACR1552U Series is capable of the three modes of NFC, namely: card reader/writer, card emulation and keyboard emulation. It also has a built-in SAM slot for added security in both contact and contactless applications.

Compliant with both CCID and PC/SC, this plug-and-play USB NFC device allows interoperability with different devices and applications. It is thus ideal for unconventional marketing and advertising applications like smart posters.

With additional features such as Keyboard Emulation, ACR1552U Series is a highly cost-effective, powerful all-in-one device that offers convenience and flexibility to many smart card applications.

**Table 1:** USB Interface Wiring

**Note:** The device driver should be installed for the ACR1552U to function properly through USB interface.

#### 4.1.2. Endpoints

The ACR1552U uses the following endpoints to communicate with the host computer:

**Control Endpoint** – For setup and control purposes.

**Bulk-OUT** – For commands to be sent from the host to the ACR1552U (data packet size is 64 bytes).

**Bulk-IN** – For response to be sent from the ACR1552U to the host (data packet size is 64 bytes).

**Interrupt-IN** – For card status message to be sent from the ACR1552U to the host (data packet size is 8 bytes).

## 4.2. Contactless Smart Card Interface

The interface between the ACR1552U and the contactless card follows the specifications of ISO 14443 with certain restrictions or enhancements to increase the practical functionality of the ACR1552U.

#### 4.2.1. Carrier Frequency

The carrier frequency for the ACR1552U is 13.56 MHz

## 5.0. Software Design

### 5.1. PCSC API

This section will describe some of the PCSC API for application programming usage. For more details, please refer to Microsoft MSDN Library or PCSC workgroup.

#### 5.1.1. SCardEstablishContext

The SCardEstablishContext function establishes the resource manager context within which database operations are performed.

Refer to: <http://msdn.microsoft.com/en-us/library/windows/desktop/aa379479%28v=vs.85%29.aspx>

This function should be performed first before any other PCSC operation.

Example:

```
#define SCARD_SCOPE_USER 0

SCARDCONTEXT hContext;
int retCode;
void main ()
{
    // To establish the resource manager context and assign it to "hContext"
    retCode = SCardEstablishContext(SCARD_SCOPE_USER,
                                   NULL,
                                   NULL,
                                   &hContext);
    if (retCode != SCARD_S_SUCCESS)
    {
        // Establishing resource manager context failed
    }
    else
    {
        // Establishing resource manager context successful
        // Further PCSC operation can be performed
    }
}
```

### 5.1.2. SCardListReaders

The SCardListReaders function provides the list of readers within a set of named reader groups, eliminating duplicates.

The caller supplies a list of reader groups, and receives the list of readers within the named groups. Unrecognized group names are ignored. This function only returns readers within the named groups that are currently attached to the system and available for use.

Refer to: <http://msdn.microsoft.com/en-us/library/windows/desktop/aa379793%28v=vs.85%29.aspx>

Example:

```
#define SCARD_SCOPE_USER 0

SCARDCONTEXT hContext; // Resource manager context
int retCode;
char readerName [256]; // List reader name

void main ()
{
    // To establish the resource manager context and assign to "hContext"
    retCode = SCardEstablishContext(SCARD_SCOPE_USER,
        NULL,
        NULL,
        &hContext);
    if (retCode != SCARD_S_SUCCESS)
    {
        // Establishing resource manager context failed
    }
    else
    {
        // Establishing resource manager context successful
        // List the available reader which can be used in the system
        retCode = SCardListReaders (hContext,
            NULL,
            readerName,
            &size);
        if (retCode != SCARD_S_SUCCESS)
        {
            // Listing reader fail
        }
        if (readerName == NULL)
        {
            // No reader available
        }
        else
        {
            // Reader listed
        }
    }
}
}
```

### 5.1.3. SCardConnect

The SCardConnect function establishes a connection (using a specific resource manager context) between the calling application and a smart card contained by a specific reader. If no card exists in the specified reader, an error is returned.

Refer to: <http://msdn.microsoft.com/en-us/library/windows/desktop/aa379473%28v=vs.85%29.aspx>

Example:

```
#define SCARD_SCOPE_USER 0

SCARDCONTEXT      hContext;          // Resource manager context
SCARDHANDLE       hCard;             // Card context handle
unsigned long     dwActProtocol;     // Establish active protocol
int               retCode;
char              readerName [256]; // List reader name
char              rName [256];      // Reader name for connection

void main ()
{
    ...
    if (readerName == NULL)
    {
        // No reader available
    }
    else
    {
        // Reader listed
        rName = "ACS ACR1552 1S CL Reader PICC 0"; // Depends on what
                                                    // reader be used
                                                    // Should connect to
                                                    // PICC interface

        retCode = SCardConnect(hContext,
                                rName,
                                SCARD_SHARE_SHARED,
                                SCARD_PROTOCOL_T1,
                                &hCard,
                                &dwActProtocol);
        if (retCode != SCARD_S_SUCCESS)
        {
            // Connection failed (May be because of incorrect reader
            // name, or no card was detected)
        }
        else
        {
            // Connection successful
        }
    }
}
```

#### 5.1.4. SCardControl

The SCardControl function gives you direct control of the reader. You can call it any time after a successful call to SCardConnect and before a successful call to SCardDisconnect. The effect on the state of the reader depends on the control code.

Refer to: <http://msdn.microsoft.com/en-us/library/windows/desktop/aa379474%28v=vs.85%29.aspx>

**Note:** Commands from

**Escape** Command use this API for sending.

Example:

```
#define SCARD_SCOPE_USER    0

#define EscapeCommand 0x310000 + 3500*4
SCARDCONTEXT             hContext;           // Resource manager context

### 5.1.5. SCardTransmit

The SCardTransmit function sends a service request to the smart card and expects to receive data back from the card.

Refer to: <http://msdn.microsoft.com/en-us/library/windows/desktop/aa379804%28v=vs.85%29.aspx>

**Note:** APDU Commands (i.e. the commands sent to connected card, **PCSC Pseudo APDU (with Proprietary Extension) for PICC**, and **Proprietary Pseudo APDU for PICC**) use this API for sending.

Example:

```
#define SCARD_SCOPE_USER      0

SCARDCONTEXT      hContext;          // Resource manager context
SCARDHANDLE       hCard;            // Card context handle

### 5.1.6. SCardDisconnect

The **SCardDisconnect** function terminates a connection previously opened between the calling application and a *smart card* in the target *reader*.

Refer to: <http://msdn.microsoft.com/en-us/library/windows/desktop/aa379475%28v=vs.85%29.aspx>

This function is used to end the PCSC Operation.

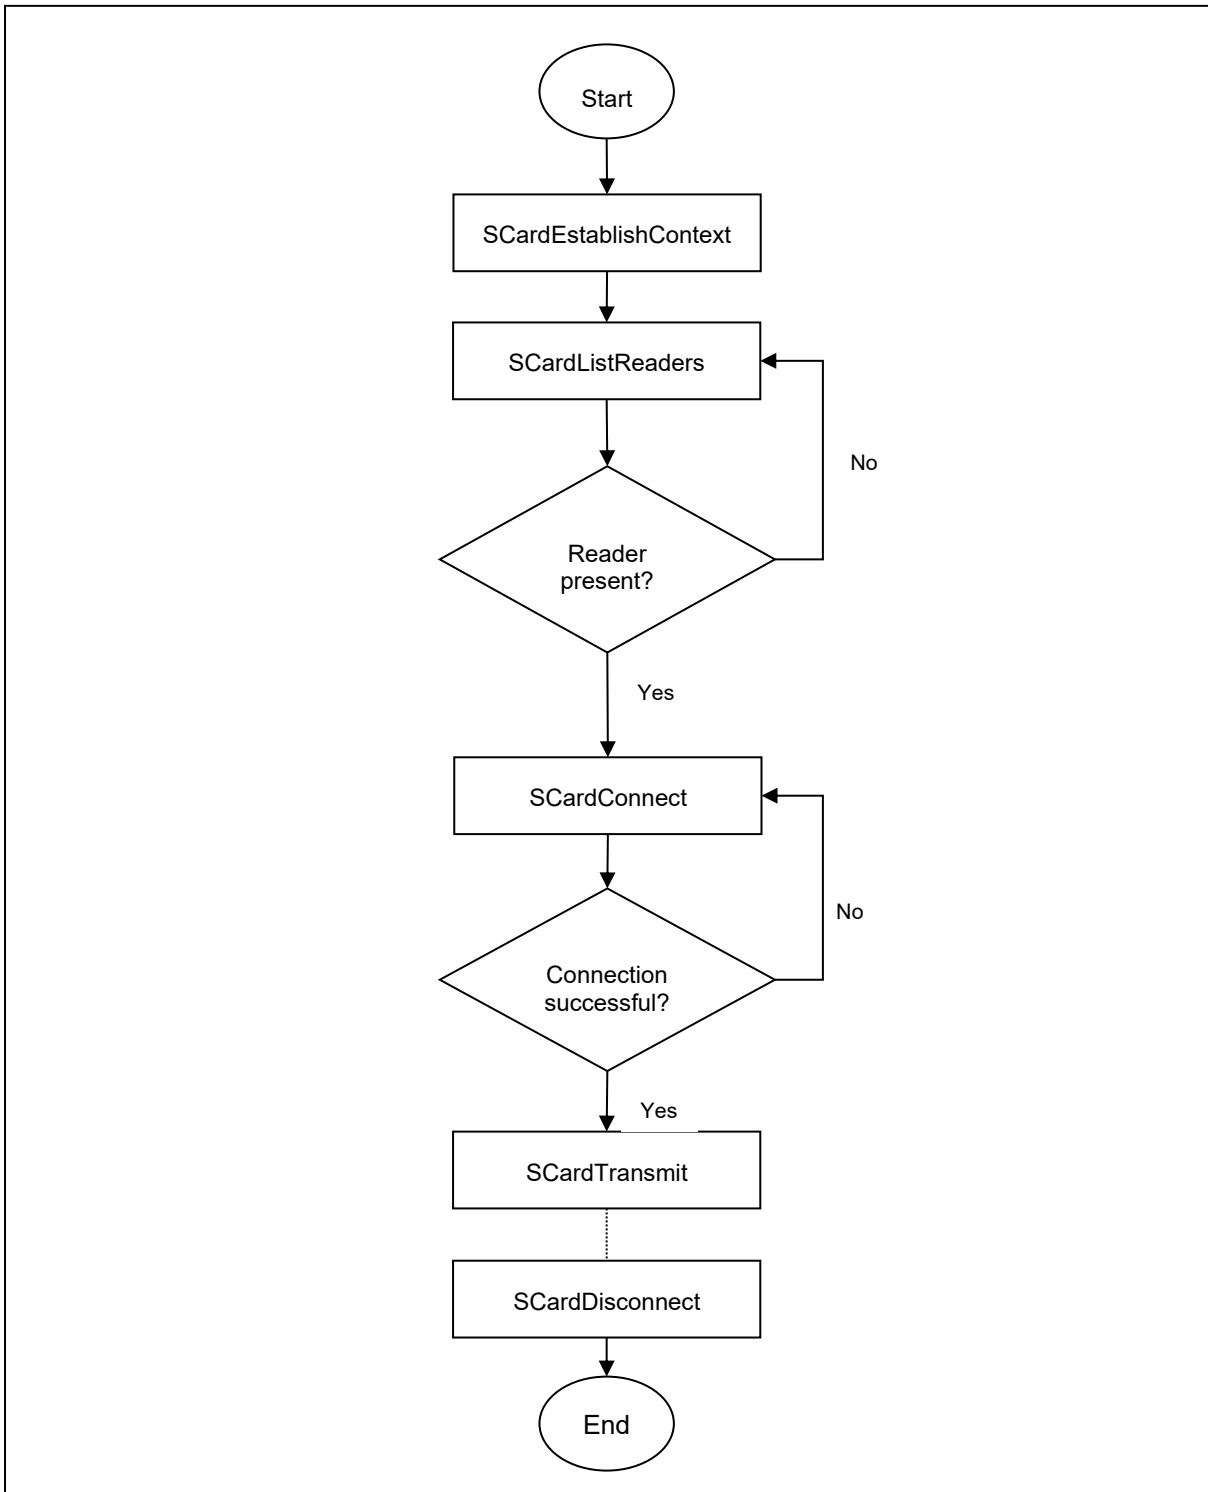

Example:

```
#define SCARD_SCOPE_USER 0

SCARDCONTEXT      hContext;          // Resource manager context
SCARDHANDLE       hCard;            // Card context handle
unsigned long     dwActProtocol;    // Established active protocol
int               retCode;

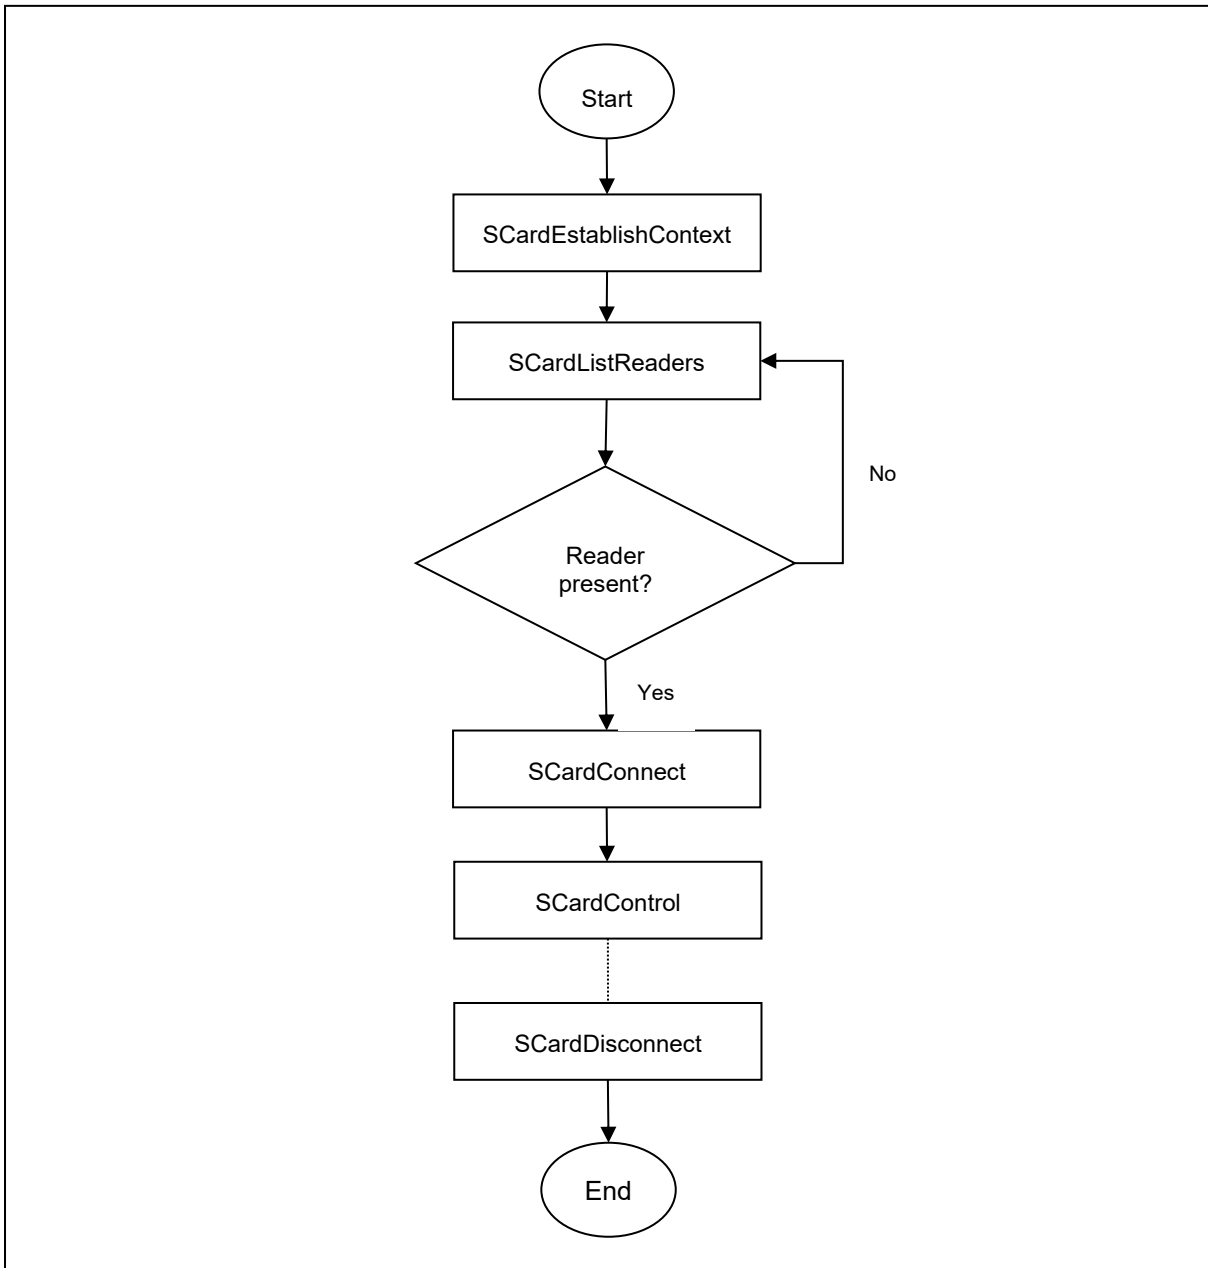

void main ()
{
    ...
    // Connection successful
    ...
    retCode = SCardDisconnect(hCard, SCARD_RESET_CARD);
    if (retCode != SCARD_S_SUCCESS)
    {
        // Disconnection failed
    }
    else
    {
        // Disconnection successful
    }
}
}
```

### 5.2.1. ACOS6-SAM Commands

This section contains SAM-specific commands. CCID Host could send Card Native Command or APDU to the Reader by using SCardTransmit() in PCSC API.

*Note: Please note that the ACOS6-SAM component is only included in the ACR1552U SDK package bundled with the reader. It is not part of the standard retail version of the reader. For complete information on ACOS6-SAM Commands and Scenarios, please contact an ACS representative for a copy of the ACOS6-SAM Reference Manual.*

### 5.2.1.10. Get Key

This command allows secure key injection from the current SAM's Key File (SFI=02h) into another ACOS6/ACOS6-SAM with or without key diversification. Using this ensures that the keys to be injected are protected by encryption and message authentication codes.

The Get Key command also allows secure key injection from the current SAM's Key File (SFI=02h) into ACOS7/10, MIFARE DESFire, MIFARE DESFire EV1/EV2/Light or MIFARE Plus card with key diversification. Using this ensures that the key to be injected is protected by encryption and message authentication codes.

If bit 7 of the Special Function Flag (Key Injection Only Flag) of the **Card Header Block** (Section 4.2 of ACOS6-SAM Reference Manual) has been set and the key file has been activated, Get Key must be used for loading or changing keys in the card. Setting this bit will disable Read Record command for the key file under any circumstances after activation.

Before this command is to be executed, a session key is already established with the target card with the mutual authentication procedure of **Mutual Authentication** (Section 6.3 of ACOS6-SAM Reference Manual) or the MIFARE Plus/MIFARE DESFire mutual authentication procedure.

**Note:** The GET KEY command can only get the Key data.

### 5.3.2. APDU, Pseudo APDU and Card Native Command

CCID Host could send Card Native Command or APDU to the Reader by using SCardTransmit() in PCSC API. For PICC, if the card support ISO14443 part 4 protocol or Innovatron protocol, the Reader will pack the Command/APDU into the protocol frame and send to the card directly without any interpretation of the Command/APDU. If the card do not support neither protocol, a message “6A 81” will return to CCID Host.

Note: Due to Microsoft Window Smart Card Plug and Play, Microsoft Window may send some APDU to a card at the time of card present. This action will make a DESFire card entering ISO APDU mode such that the card become fail to receive a native command until a card reset. Usually Microsoft Window will reset the card (by PC\_to\_RDR\_IccPowerOff) after 10s of inactive.

### 5.3.3. PCSC Pseudo APDU (with Proprietary Extension) for PICC

The following Pseudo APDUs are provided to access a contactless card indirectly. CCID Host could send these APDUs to Reader by using SCardTransmit() in PCSC API. After receiving of a Pseudo APDU, it will be interpreted to generate low level card command(s) and then send to card. After the card handling those low level command(s), Reader collect the response(s) from the card and create a response to send back to CCID Host.

### 5.3.3.4. Read Binary Blocks [FF B0 ...]

This command is used to read specified number of byte of data from PICC starting from the specified block/page address. Depend on card type, user may need to perform authentication to get the access right of the required block(s)/page(s) before sending this command.

// Block 80h to Block 8Eh (15 blocks)

APDU = FF B0 00 80 F0h

### 5.3.3.5. Update Binary Blocks [FF D6 ...]

This command is used to write specified number (must be multiple of block/page size) of bytes to PICC starting from the specified block/page address. Depend on card type, user may need to perform authentication to get the access right of the required block(s)/page(s) before sending this command.

User should take a great care for writing to block/page that may change the security setting of the card (e.g. sector trailers of MIFARE card) as this may lock the card if incorrect data is written or operation is failed. As a result, to minimize the risk of card locking, it is not recommended to write to multiple block/page in a single APDU command if security block/page is involved.

### 5.3.5. APDU Commands for PCSC 2.0 Part 3 (Version 2.02 or above)

PCSC2.0 Part 3 commands are used to transparently pass data from an application to a contactless tag, return the received data transparently to the application and protocol, and switch the protocol simultaneously.

#### 5.3.5.1. PCSC 2.0 Part 3 Flow

**Figure 5:** ACR1552U Transparent Session Flow

### 5.3.5.2. Command and Response APDU Format

Command Format

CLA	INS	P1	P2	Lc	Data In
FFh	C2h	00h	Function	DataLen	Data[DataLen]

**Where Functions (1 byte):**

- 00h = Manage Session
- 01h = Transparent Exchange
- 02h = Switch Protocol
- Other = RFU

Response Format

Data Out	SW1	SW2
Data Field BER-TLV encoded		

Every command returns SW1 and SW2 together with the response data field (if available). The SW1 SW2 is based on ISO 7816. SW1 SW2 from the C0 data object below should also be used.

C0 data element Format

Tag	Length (1 byte)	SW2
C0h	03h	Error Status

Error Status Description

Error Status	Description
XX SW1 SW2	XX = number of the bad data object in the APDU 00 = general error of APDU 01 = error in the 1 <sup>st</sup> data object 02 = error in the 2 <sup>nd</sup> data object
00 90 00h	No error occurred
XX 62 82h	Data object XX warning, requested information not available
XX 63 00h	No information
XX 63 01h	Execution stopped due to failure in other data object
XX 6A 81h	Data object XX not supported
XX 67 00h	Data object XX with unexpected length
XX 6A 80h	Data object XX with unexpected value
XX 64 00h	Data Object XX execution error (no response from IFD)
XX 64 01h	Data Object XX execution error (no response from ICC)
XX 6F 00h	Data object XX failed, no precise diagnosis

The first value byte indicates the number of the erroneous data object XX, while the last two bytes indicate the explanation of the error. SW1 SW2 values based on ISO 7816 are allowed.

If there are more than one data objects in the C-APDU field and one data object failed, IFD can process the following data objects if they do not depend on the failed data objects.

### 5.3.6.3. Decrement/Increment Value [FF D7 ...]

This command is used to decrement/increment a 4-byte value from source block and stores the result to target block in a card compatible with MIFARE Standard. If user wants to store the result to the block same as source block, user can set the target block number equal to 0 or source block number. User should perform succeed authentication to get the access right of both source and target block before sending this command.

### 5.3.7. Accessing PCSC-Compliant tags (ISO14443-4)

All ISO 14443-4 compliant cards (PICCs) understand the ISO 7816-4 APDUs. The ACR1552U reader just has to communicate with the ISO 14443-4 compliant cards by exchanging ISO 7816-4 APDUs and responses. The ACR1552U will handle the ISO 14443 Parts 1-4 Protocols internally.

MIFARE Classic (1K/4K), MIFARE Mini and MIFARE Ultralight tags are supported through the T=CL emulation. Just simply treat the MIFARE tags as standard ISO 14443-4 tags. For more information, please refer to **PCSC Pseudo APDU (with Proprietary Extension) for PICC**.

#### ISO 7816-4 APDU Format

Command	Class	INS	P1	P2	Lc	Data In	Le
ISO 7816 Part 4 Command					Length of the Data In		Expected length of the Response Data

#### ISO 7816-4 Response Format (Data + 2 bytes)

Response	Data Out		
Result	Response Data	SW1	SW2

#### Common ISO 7816-4 Response Codes

Results	SW1 SW2	Meaning
Success	90 00h	The operation was completed successfully.
Error	63 00h	The operation failed.

Typical sequence may be:

1. Present the tag and connect the PICC Interface.
2. Read/Update the memory of the tag.

To do this:

1. Connect the tag.

The ATR of the tag is 3B 88 80 01 00 00 00 00 33 81 81 00 3Ah.

In which,

The Application Data of ATQB = 00 00 00 00, protocol information of ATQB = 33 81 81. It is an ISO 14443-4 Type B tag.

2. Send an APDU, Get Challenge.

<< 00 84 00 00 08h

>> 1A F7 F3 1B CD 2B A9 58h [90 00h]

**Note:** For ISO 14443-4 Type A tags, the ATS can be obtained by using the APDU "FF CA 01 00 00h."

**Example:**

```
// Read 8 bytes from an ISO 14443-4 Type B PICC (ST19XR08E)
```

```
APDU = {80 B2 80 00 08h}
```

```
Class = 80h
```

```
INS = B2h
```

```
P1 = 80h
```

```
P2 = 00h
```

```
Lc = None
```

```
Data In = None
```

```
Le = 08h
```

```
Answer: 00 01 02 03 04 05 06 07h [$9000h]
```

## 6.0. Escape Command

The following commands are provided to configure PCD/NFC and to access special function of the reader. CCID Host could send these commands to reader by using SCardControl() with SCARD\_CTL\_CODE(3500) in PCSC API. After receiving of an Escape Command, it will be interpreted to perform various operations and then generate a response to send back to CCID Host.

**Note:**

Should send these commands under correct interface. For example, E0 00 00 25 01 00 (Section 6.1.1) should send through PICC interface (Section 6.0).

**6.1.7. Get Auto PPS [E0 00 00 24 00]**

Whenever a PICC is recognized, the reader will try to change the communication speed between the PCD and PICC as defined by the maximum connection speed. If the card does not support the proposed connection speed, the reader will try to connect the card with a slower speed setting.

Command

Command	Class	INS	P1	P2	Le
Get Auto PPS	E0h	00h	00h	24h	00h

Response Code

Response	Class	INS	P1	P2	Le	Data In	
Result	E1h	00h	00h	00h	02h	Max Speed	Current Speed

**6.1.8. Set Auto PPS [E0 00 00 24 01 ...]**

This command is used to set the auto PPS.

Command

Command	Class	INS	P1	P2	Lc	Data Out
Set Auto PPS	E0h	00h	00h	24h	01h	Max Speed

Response Code

Response	Class	INS	P1	P2	Le	Data In	
Result	E1h	00h	00h	00h	02h	Max Speed	Current Speed

Speed of PPS

Speed	Description
00h	106 kbps; equal to No Auto PPS
01h	212 kbps
02h	424 kbps
03h	848 kbps

Default Setting – 02h (424 kbps)

**Notes:**

1. Normally, the application should know the maximum connection speed of the PICCs being used. The environment also affects the maximum achievable speed. The reader just uses the proposed communication speed to talk with the PICC. The PICC will become inaccessible if the PICC or environment does not meet the requirement of the proposed communication speed.

2. If the higher speed setting affects the performance of the reader, please switch back to a lower speed setting.

**Notes:**

For more detailed information and specifications related to the NDEF (NFC Data Exchange Format), I would recommend referring to the NDEF specification. It provides comprehensive guidelines and details about the structure and usage of NDEF records, which are commonly used in NFC data exchange. The NDEF specification will provide a deeper understanding of how to interpret and utilize the NDEF command and data in the context of the ACR1552U device.
